

CLAIMS

1. One-part case for digital records' carriers with possibility of connexion with cases of the same type consists of the lower portion (1) and the upper portion (2) which have approximately the form of mirror-symmetrical thin square plates with rounded corners and rounded front sides, with the insides formed so as to hold the circular flat discs such as CDs or DVDs, characterized by, the fact that the lower portion (1) and the upper portion (2) of the case are connected by one or more folding joints (3) which when completely open have the shape of a short bridge connecting the rear part of the lower portion (1) of the case with the rear part of the upper portion (2) of the case and with the arc which is the thinnest in the middle of this bridge, the fact that two or more corner surfaces of the lower portion (1) of the case not covered by the disc are fitted with elastic consoles (4) for joining the cases of the same type which are shaped as rectangular plates designed so that the lower portion (1) on its three sides is fitted with a slot (5) which releases it from the connection with the lower portion (1), and which is on the fourth side connected with the lower portion (1), the root of which is fitted with a groove (17), and whose loose end is bent at the right angle towards the outer surface of the lower portion (1) so that it forms a low protruding element (18) with tooth (19) and which is initially inclined at a small angle towards the inside of the lower portion (1), the fact that two or more corner surfaces of the upper portion (2) of the case are fitted with the slots (6) with step (20) for joining the cases of the same type, which are mirror-symmetrical by protruding elements (18) of the elastic consoles (4) into which the protruding element (18) can be inserted with tooth (19) of other cases, that the outer surfaces of the case are fitted with the elements for interpositioning of the cases in the form of at least three spherical projections (7) on the outer part of the lower portion (1) and at least three spherical indentations (8) on the outer surface of the upper portion (2) with the diameter equal to or greater than the spherical projections (7) and mirror-symmetrical to the spherical projections (7) and the shallow rectangular indentation (9) for the label marking the contents of the case designed on the front side of the outer surface of the upper portion (2) of the case, the fact that the front side of the upper portion (2) is fitted with the elastic console (10) formed by two lateral slots (11) and a transversal groove (12) and which is fitted with a vertical tang (13) with tooth (14), and on the front side of the lower portion (1) of the case there is a groove (15) below the edge (16) and the

fact that the bond of the lower portion (1) of the case and the upper portion (2) of the case is locked by the snapping joint between the tooth (14) and the groove (15).

2. One-part case for digital records' carriers with possibility of connexion with cases of the same type according to claim 1, **characterized by**, the fact that it has been made of the
5 polymeric material by the technology of injection moulding.

3. The connecting procedure of the cases of the same type according to claims 1 and 2, **characterized by**, the fact that the cases of the same type are connected manually into separable stacks of two or more cases of the same type using the elements for interpositioning of the cases in such a way that on the lower closed and locked case, an
10 upper case physically oriented in the same direction as the lower case with the spherical projections (7) on the lower portion (1) of the upper case sliding into the spherical indentations (8) on the upper portion (2) of the lower case and the elements for interconnecting of cases so that the protruding elements (18) with teeth (19) at the loose
15 ends of the elastic consoles (4) of the upper open case are pressed by hand into the mating stepped slots (6) on the upper portion (2) of the lower case.
